Soil Sampling Instruction Sheet

Soil Sampling

A soil analysis is only as good as the soil sample from which it is taken.

Each sample should be a composite of 10-20 sub-samples taken at random across the field. The sub-samples are placed in the supplied plastic bag, mixed thoroughly by hand, before filling the cardboard sample container. To keep your sample as representative of the field as possible avoid field gates, water troughs, feed rings etc. It is often useful to walk across the field in a 'W' pattern to aid sampling.

'W' Pattern Field Sampling

- 1) Write the field name on the sample container and tick the boxes for the analysis requested.**
- 2) Take a representative soil sample from the field.**
- 3) Return your samples to MacaulaySoils.com using the pre-paid address label.**
